

*In the Claims*

The status of claims in the case is as follows:

1        1.    [Previously presented] A method for control and  
2        management of communication traffic, comprising the steps  
3        of:

4            expressing access rules as filters referencing system  
5            kernel data;

6            for outbound processing, determining source application  
7            indicia;

8            for inbound packet processing, executing a look-ahead  
9            function to determine target application indicia; said  
10          look-ahead function being executed within a protocol  
11          stack including an IP layer, a transport layer, a  
12          sockets layer, and an application layer and which, for  
13          said inbound packet, said IP layer provides to said  
14          transport layer said inbound packet, marked as non-  
15          deliverable, and receives back from said transport  
16          layer indicia, provided to said transport layer by said

END920010019US1

2 of 39

S/N 09/919,185

17 sockets layer, identifying the application layer  
18 application to which said packet would have been  
19 delivered; and

20 responsive to said source or target application  
21 indicia, executing filter processing; said filter  
22 processing including constructing and evaluating  
23 logical expressions of arbitrary length, and  
24 selectively using a set of logical operators,  
25 alternative filter selector fields, and value set.

1 2. [Currently amended] The method of claim 1, wherein  
2 said protocol stack is a TCP/IP protocol stack, and further  
3 comprising the steps of executing said determining and  
4 executing steps within a kernel filtering function upon  
5 encountering a filter selector field referencing kernel data  
6 not included in said packet.

1 3. [Currently amended] The method of claim 1, wherein  
2 said protocol stack is a TCP/IP protocol stack, and said  
3 filter processing including the steps of:

4 determining a task or thread identifier;

5 based on said task or thread identifier, determining a

END920010019US1

3 of 39

S/N 09/919,185

6 process or job identifier; and

7 based on said process or job identifier, determining  
8 job or process attributes for filter processing.

1 4. [Currently amended] The method of claim 1, wherein  
2 said protocol stack is a TCP/IP protocol stack, and said  
3 filter processing including the steps of:

4 determining a user identifier; and

5 based on said user identifier, determining user  
6 attributes for filter processing.

1 5. [Original] The method of claim 3, further comprising  
2 the step of determining from said task identifier a work  
3 control block containing said process or job identifier.

1 6. [Canceled]

2 7. [Canceled]

1 8. [Currently amended] The method of claim 1, wherein  
2 said protocol stack is a TCP/IP protocol stack, and further

END920010019US1

4 of 39

S/N 09/919,185

3 comprising the steps of:

4 delivering to said filters infrastructure access rules  
5 for defining security context.

1 9. [Original] The method of claim 8, said infrastructure  
2 including logging, auditing, and filter rule load controls.

1 10. [Previously presented] A method for control and  
2 management of aspects of communication traffic within  
3 filtering, comprising the steps of:

4 receiving IP packet data into a TCP/IP protocol stack  
5 executing within a system kernel;

6 for an inbound IP packet, executing a look-ahead  
7 function within a protocol stack including an IP layer,  
8 a transport layer, a sockets layer, and an application  
9 layer and which, for said IP inbound packet, said IP  
10 layer provides to said transport layer said inbound IP  
11 packet, marked as non-deliverable, and receives back  
12 from said transport layer indicia, provided to said  
13 transport layer by said sockets layer, identifying the  
14 application layer application to which said packet  
15 would have been delivered; and

END920010019US1

5 of 39

S/N 09/919,185

16           executing filtering code within said system kernel with  
17           respect to non-IP packet data accessed within said  
18           system kernel outside of said TCP/IP protocol stack;  
19           said filtering code constructing and evaluating logical  
20           expressions of arbitrary length, and selectively using  
21           a set of logical operators, alternative filter selector  
22           fields, and value set.

1       11. [Original] The method of claim 10, said non-IP packet  
2       data including context data regarding said IP packet.

1       12. [Original] The method of claim 10, said non-IP packet  
2       data including data specific to a task generating said non-  
3       IP packet data.

1       13. [Original] The method of claim 10, said non-IP packet  
2       data including data specific to a task that will receive  
3       said IP packet.

1       14. [Original] The method of claim 11, said context data  
2       including packet arrival interface indicia.

15. [Canceled]

6 of 39

S/N 09/919,185

1 18. [Previously presented] A method for centralizing  
2 system-wide communication management and control within  
3 filter rules, comprising the steps of:

4 providing filter statements syntax for accepting  
5 parameters in the form of a selector, each selector  
6 specifying selector field, operator, and a set of  
7 values;

8 for an inbound packet, executing a look-ahead function  
9 within a protocol stack including an IP layer, a  
10 transport layer, a sockets layer, and an application  
11 layer and which, for said inbound packet, said IP layer  
12 provides to said transport layer said inbound packet,  
13 marked as non-deliverable, and receives back from said  
14 transport layer indicia, provided to said transport  
15 layer by said sockets layer, identifying the  
16 application layer application to which said packet  
17 would have been delivered by said sockets layer;

18 said selector referencing data that does not exist in  
19 IP packets;

20 processing said filter statements, including  
21 constructing and evaluating logical expressions of

END920010019US1

7 of 39

S/N 09/919,185

22 arbitrary length, and selectively using a set of  
23 logical operators, alternative filter selector fields,  
24 and value set.

1 19. [Currently amended] The method of claim 18, wherein  
2 said protocol stack is a TCP/IP protocol stack, and said  
3 parameters selectively including userid, user profile, user  
4 class, user group, user group authority, user special  
5 authority, job name, process name, job group, job class, job  
6 priority, other job or process attributes, and date & time.

1 20. [Currently amended] The method of claim 18, wherein  
2 said protocol stack is a TCP/IP protocol stack, and said  
3 filters statements being provided within a user interface to  
4 said system.

1 21. [Currently amended] The method of claim 18, wherein  
2 said protocol stack is a TCP/IP protocol stack, and further  
3 comprising the steps of:

4 establishing a tunnel between two IP address limiting  
5 traffic to applications bound to ports at each end of  
6 said tunnel;

7 said filtering code accessing filtering attributes

END920010019US1

8 of 39

S/N 09/919,185

8 further limiting traffic selectively to job indicia;  
9 and

10 operating said filtering code within a kernel filtering  
11 function upon encountering a filter selector field  
12 referencing kernel data not included in said traffic.

1 22. [Currently amended] A method for traversing a portion  
2 only of a protocol stack to disallow selective IP packet  
3 traffic, comprising the steps of:

4 receiving a packet in the kernel of the operating  
5 system of a first node from an application, said kernel  
6 including a filter processor; said filter processor for  
7 constructing and evaluating logical expressions of  
8 arbitrary length, said logical expressions selectively  
9 including a set of logical operators, alternative  
10 filter selector fields, and value set;

11 for inbound packet processing to a first node from a  
12 second node, executing a look-ahead function in the  
13 system kernel of said first node to determine a target  
14 application; said system kernel including a TCP/IP  
15 protocol stack including an IP layer, a transport  
16 layer, a sockets layer, and an application layer and

END920010019US1

9 of 39

S/N 09/919,185

17           which, for said inbound packet, said IP layer provides  
18           to said transport layer said inbound packet, marked as  
19           non-deliverable, and receives back from said transport  
20           layer indicia identifying the application layer  
21           application to which said packet would have been  
22           delivered;

23           for both said inbound packet processing, and for  
24           outbound packet processing from said first node to said  
25           second node, executing within said kernel the steps of

26                     processing said packet by determining a task ID;

27                     responsive to said task ID, determining a  
28                     corresponding work control block;

29                     determining a user ID, process or job identifier  
30                     from said work control block;

31                     from the user ID, process or job identifier  
32                     selectively determining attributes for said user  
33                     process or job; and

34                     passing said attributes to said filter processor  
35                     for managing and controlling communication

36 traffic.

1 23. [Previously presented] A method for expressing access  
2 rules as filters, comprising the steps of:

3 providing a filter statements syntax for accepting  
4 parameters in the form of a selector, each selector  
5 specifying selector field, operator, and a set of  
6 values; and

7 said selector referencing data that does not exist in  
8 IP packets for controlling access to an application;

9 for an inbound IP packet, executing a look-ahead  
10 function within a protocol stack including an IP layer,  
11 a transport layer, a sockets layer, and an application  
12 layer and which, for said IP inbound packet, said IP  
13 layer provides to said transport layer said inbound IP  
14 packet, marked as non-deliverable, and receives back  
15 from said transport layer indicia, provided to said  
16 transport layer by said sockets layer, identifying the  
17 application layer application to which said packet  
18 would have been delivered; and

19 processing said filter statements by constructing and

20 evaluating logical expressions of arbitrary length,  
21 said logical expressions selectively including a set of  
22 logical operators, alternative filter selector fields,  
23 and value set referencing said application layer  
24 application.

1 24. [Previously presented] A method for managing and  
2 controlling communication traffic by centralizing access  
3 rules in filters executing within and referencing data  
4 available in system kernels, comprising the steps for  
5 outbound packet processing from a first node to a second  
6 node of:

7 receiving said packet in the kernel of the operating  
8 system of said first node from an application or  
9 process at said first node;

10 processing said packet by determining a task ID;

11 responsive to said task ID, determining a corresponding  
12 work control block;

13 responsive to said work control block, determining a  
14 process or job identifier;

END920010019US1

12 of 39

S/N 09/919,185

15 responsive to said process or job identifier,  
16 determining job or process attributes; and  
  
17 executing said filters by constructing and evaluating  
18 logical expressions of arbitrary length, said logical  
19 expressions selectively including a set of logical  
20 operators, alternative filter selector fields, and  
21 value set.

1 25. [Previously presented] The method of claim 24, further  
2 comprising the steps for inbound packet processing from said  
3 second node to said first node of:

4 initially operating said kernel at said first node to  
5 determine a target application for said packet at said  
6 first node by executing a look-ahead function within a  
7 protocol stack including an IP layer, a transport  
8 layer, a sockets layer, and an application layer and  
9 which, for said inbound packet, said IP layer provides  
10 to said transport layer said inbound packet, marked as  
11 non-deliverable, and receives back from said transport  
12 layer indicia, provided to said transport layer by said  
13 sockets layer, identifying the application layer  
14 application to which said packet would have been  
15 delivered;.

32 said first, second, third, fourth, fifth, and sixth  
33 code is recorded on said computer readable medium.

42. [Canceled]

1 43. [Previously presented] A system for control and  
2 management of communication traffic with respect to a system  
3 node, comprising:

4 a filtering function executing within a protocol stack  
5 of the system kernel of said system node identifying  
6 for an inbound packet a filter referencing non-packet  
7 data; and

8 a look-ahead function responsive to said filter for  
9 identifying a target application for said inbound  
10 packet; said look-ahead function functioning within a  
11 protocol stack including an IP layer, a transport  
12 layer, a sockets layer, and an application layer and  
13 which, for said inbound packet, said IP layer provides  
14 to said transport layer said inbound packet, marked as  
15 non-deliverable, and receives back from said transport  
16 layer indicia, provided to said transport layer by said  
17 sockets layer, identifying the application layer  
18 application to which said packet would have been

19 delivered;; and

20 a filter processor for constructing and evaluating  
21 logical expressions of arbitrary length, said logical  
22 expressions selectively including a set of logical  
23 operators, alternative filter selector fields, and  
24 value set.

44. [Canceled]

1 45. [Previously presented] A computer program product for  
2 control and management of aspects of communication traffic  
3 within filtering, said computer program product comprising:

4 a computer readable medium;

5 first program instructions to receive IP packet data  
6 into a TCP/IP protocol stack executing within a system  
7 kernel including, for processing an inbound IP packet,  
8 a look-ahead function within a protocol stack including  
9 an IP layer, a transport layer, a sockets layer, and an  
10 application layer and which, for said IP inbound  
11 packet, said IP layer provides to said transport layer  
12 said inbound IP packet, marked as non-deliverable, and  
13 receives back from said transport layer indicia,

END920010019US1

27 of 39

S/N 09/919,185

14 provided to said transport layer by said sockets layer,  
15 identifying the application layer application to which  
16 said packet would have been delivered;

17 second program instructions to execute filtering code  
18 within said system kernel with respect to non-IP packet  
19 data accessed within said system kernel outside of said  
20 TCP/IP protocol stack by constructing and evaluating  
21 logical expressions of arbitrary length, said logical  
22 expressions selectively including a set of logical  
23 operators, alternative filter selector fields, and  
24 value set; and wherein

25 said first and second program instructions are recorded  
26 on said medium.

1 46. [Previously presented] A computer program product for  
2 centralizing system-wide communication management and  
3 control within filter rules, said computer program product  
4 comprising:

5 a computer readable medium;

6 first program instructions to execute filter statements  
7 having a syntax for accepting parameters in the form of

8 a selector, each selector specifying selector field, a  
9 logical operator selected from a set of a plurality of  
10 logical operators, and a set of values; and

11 second program instructions to cause said selector to  
12 reference data that does not exist in IP packets, said  
13 data including application layer indicia obtained for  
14 an incoming packet by a look-ahead function; said look-  
15 ahead function executing within a protocol stack  
16 including an IP layer, a transport layer, a sockets  
17 layer, and an application layer and which, for said IP  
18 inbound packet, said IP layer provides to said  
19 transport layer said inbound IP packet, marked as non-  
20 deliverable, and receives back from said transport  
21 layer indicia, provided to said transport layer by said  
22 sockets layer, identifying the application layer  
23 application to which said packet would have been  
24 delivered; and wherein

25 said first and second program instructions are recorded  
26 on said medium.

1 47. [Previously presented] A computer program product for  
2 managing and controlling communication traffic by  
3 centralizing access rules in filters executing within and

4       referencing data available in system kernels, said computer  
5       program product comprising:

6             a computer readable medium;

7             first program instructions to receive said packet in  
8             the kernel of the operating system of said first node  
9             from a process at said first node;

10            second program instructions to process said packet by  
11            determining a task ID;

12            third program instructions, responsive to said task ID,  
13            to determine a corresponding work control block;

14            fourth program instructions, responsive to said work  
15            control block, to determine a process or job  
16            identifier;

17            fifth program instructions, responsive to said process  
18            or job identifier, to determine job or process  
19            attributes; and

20            sixth program instructions to execute a filter  
21            processor for constructing and evaluating logical

22 expressions of arbitrary length, said logical  
23 expressions selectively including a set of logical  
24 operators, alternative filter selector fields, and  
25 value set; and wherein  
  
26 said first, second, third, fourth, fifth, and sixth  
27 program instructions are recorded on said medium.

1 48. [Currently amended] The computer program product of  
2 claim 47, wherein said protocol stack is a TCP/IP protocol  
3 stack, and said computer program product further comprising  
4 for inbound packet processing from said second node to said  
5 first node:

6 sixth program instructions to initially operate said  
7 kernel at said first node to determine a target  
8 application for said packet at said first node by  
9 executing a look-ahead function within a protocol stack  
10 including an IP layer, a transport layer, a sockets  
11 layer, and an application layer and which, for said IP  
12 inbound packet, said IP layer provides to said  
13 transport layer said inbound IP packet, marked as non-  
14 deliverable, and receives back from said transport  
15 layer indicia, provided to said transport layer by said  
16 sockets layer, identifying the application layer

17 application to which said packet would have been  
18 delivered;; and wherein

19 said sixth program instructions are recorded on said  
20 medium.

1 49. [Currently amended] A computer program product for  
2 control and management of communication traffic, comprising:

3 a computer readable medium;

4 first program instructions for expressing access rules  
5 as filters referencing system kernel data;

6 second program instructions, for outbound processing,  
7 for determining a source application;

8 third program instructions, for inbound packet  
9 processing, for executing a look-ahead function to  
10 determine a target application; said look-ahead  
11 function operating within a protocol stack including an  
12 IP layer, a transport layer, a sockets layer, and an  
13 application layer and which, for said IP inbound  
14 packet, said IP layer provides to said transport layer  
15 said inbound IP packet, marked as non-deliverable, and

16 receives back from said transport layer indicia,  
17 provided to said transport layer by said sockets layer,  
18 identifying the application layer application to which  
19 said packet would have been delivered;

20 fourth program instructions, selectively responsive to  
21 said source and target application, for executing  
22 filter processing including constructing and evaluating  
23 logical expressions of arbitrary length, said logical  
24 expressions selectively including a set of logical  
25 operators, alternative filter selector fields, and  
26 value set;[[;]] and wherein

27 said first, second, third, and fourth program  
28 instructions are recorded on said computer readable  
29 medium.

1 50. [Previously presented] A computer program product for  
2 control and management of aspects of communication traffic  
3 within filtering, comprising:

4 a computer readable medium;

5 first program instructions for receiving IP packet data  
6 into a TCP/IP protocol stack executing within a system

7 kernel;

8 second program instructions for executing filtering  
9 code within said system kernel with respect to non-IP  
10 packet data accessed within said system kernel outside  
11 of said TCP/IP protocol stack; said filtering code  
12 constructing and evaluating logical expressions of  
13 arbitrary length, said logical expressions selectively  
14 including a set of logical operators, alternative  
15 filter selector fields, and value set; and wherein  
  
16 said first and second program instructions are recorded  
17 on said computer readable medium.

1 51. [Currently amended] A computer program element for  
2 centralizing system-wide communication management and  
3 control within filter rules, comprising:

4 a computer readable medium;

5 first program instructions for providing filter  
6 statements syntax for accepting parameters in the form  
7 of a selector, each selector specifying selector field,  
8 a logical operator, and a set of values,

END920010019US1

34 of 39

S/N 09/919,185

9 second program instructions for executing filtering by  
10 constructing and evaluating logical expressions of  
11 arbitrary length, said logical expressions selectively  
12 including said logical operator selected from a set of  
13 logical operators, at least one said selector field,  
14 and at least one said value;

15 said selector referencing data that does not exist in  
16 IP packets including data obtained, for an inbound IP  
17 packet, by executing a look-ahead function within a  
18 protocol stack including an IP layer, a transport  
19 layer, a sockets layer, and an application layer and  
20 which, for said IP inbound packet, said IP layer  
21 provides to said transport layer said inbound IP  
22 packet, marked as non-deliverable, and receives back  
23 from said transport layer indicia, provided to said  
24 transport layer by said sockets layer, identifying the  
25 application layer application to which said packet  
26 would have been delivered;[[;]] and wherein

27 said first and second program instructions are recorded  
28 on said computer readable medium.

1 52. [Previously presented] A computer program product for  
2 managing and controlling communication traffic by
